

VAV terminal units

Type TVB

For the most diverse application at standard volume flow with demanding acoustic requirements.
VAV terminal units for standard applications of supply air or extract air control in variable air volume systems with demanding acoustic requirements

- Suitable for the control of volume flow rate, room pressure or duct pressure
- Electronic control components for different applications (Easy, Compact, Universal)
- Accurate air flow control even with upstream radius bend ($R = 1D$)
- Suitable for air velocities up to 13 m/s
- Operation pressure 20 to 1000 Pa
- Closed blade air leakage to EN 1751, Class 2 (size 4 – 10), Class 3 (size 12,14,16)
- Integral attenuator
- Box style construction for the reduction of the airflow velocity
- Tested and certified to AHRI Standard 880-2017

Variants**Product examples****VAV terminal unit, variant TVB-A****VAV terminal unit, variant TVB-C****Description****Application**

- VAV terminal units of Type TVB for supply air or extract air flow control in variable air volume systems
- Closed-loop volume flow control using an external power supply
- Integral attenuator for demanding acoustic requirements
- Shut-off by means of switching (equipment supplied by others)

Variants

- TVB-A: VAV terminal unit
- TVB-B: VAV terminal unit with extended casing for better acoustics performance
- TVB-C: VAV terminal unit with multiple outlets
- TVB-E: VAV terminal unit with electric reheat unit
- TVB-EC: VAV terminal unit with multiple outlets and reheat unit

Nominal sizes

- 4, 5, 6, 7, 8, 10, 12, 14, 16

Attachments

- Easy controller: Compact unit consisting of controller with potentiometers, differential pressure transducer and actuator
- Compact controller: Compact unit consisting of controller, differential pressure transducer and actuator
- Universal controller: Controller, differential pressure transducer and actuators for special applications

Construction features

- Rectangular casing
- Spigot on the inlet suitable for circular ducts to DW144, 1998
- Connection on the room end suitable for air duct profiles
- Position of the damper blade indicated externally at shaft extension
- Thermal and acoustic insulation (lining)

Materials and surfaces

- Casing and damper blade made of galvanized sheet steel
- Damper blade seal made of Chloroprene rubber
- Lining is fiber glass
- Differential pressure sensor made of aluminum
- Plastic bearings

Mineral wool

- Internal fiber glass insulation lining.
- Faced with woven glass fabric as protection against fiber erosion for airflow velocities up to 20 m/s
- Resistant to fungal and bacterial growth

Installation and commissioning

- Any installation orientation (except units with static differential pressure transducer)
- Return edges of the casing with drilled holes suitable for M8 threaded rods

Standards and guidelines

- Closed blade air leakage to EN 1751, Class 2 (4 – 10), Class 3 (12, 14, 16)

Maintenance

- Maintenance-free as construction and materials are not subject to wear

Useful additions

- Hot water heat exchanger
- Electrical heater

For more details contact TROX Malaysia

Special characteristics

- Factory set-up or programming and aerodynamic function testing
- Volume flow rate can later be measured and adjusted on site; additional adjustment device may be necessary

Parts and characteristics

- Ready-to-commission unit which consists of mechanical parts and control components
- Averaging differential pressure sensor for volume flow rate measurement
- Damper blade
- Integral attenuator
- Factory assembled control components complete with wiring and tubing
- Aerodynamic functional testing on a special test rig prior to shipping of each unit
- Set-up data is given on a label or volume flow rate scale affixed to the unit

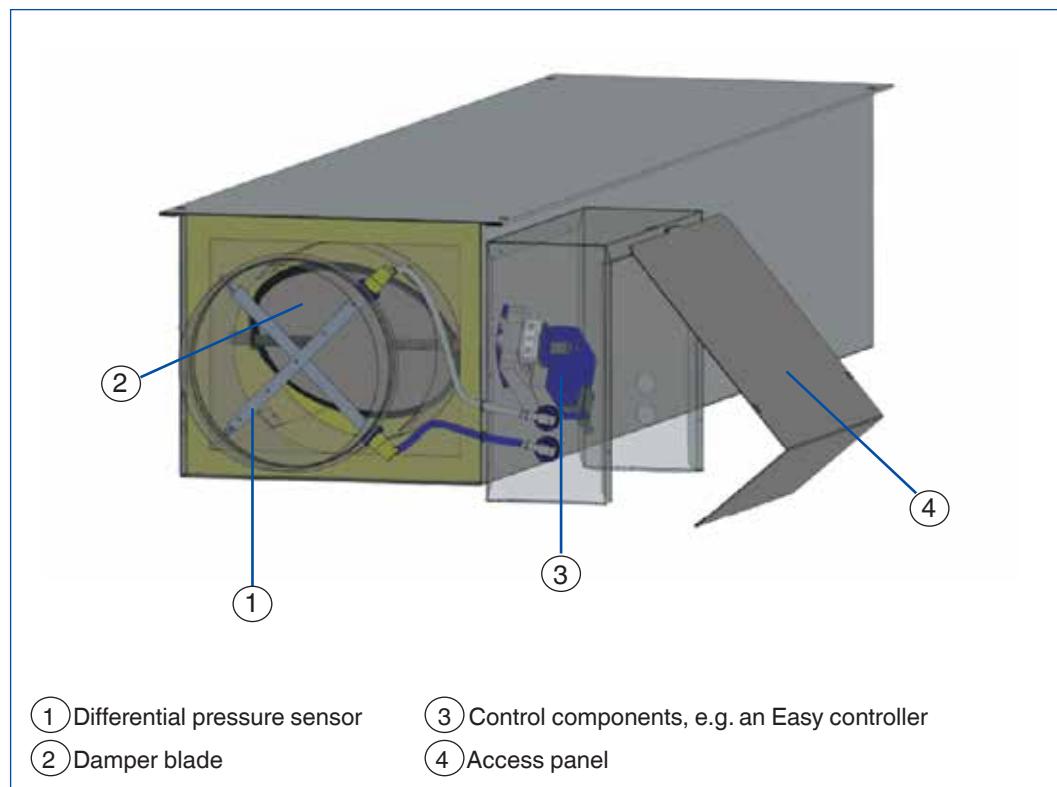

Function

Functional description

The VAV terminal unit is fitted with a differential pressure sensor for measuring the volume flow rate. The control components (attachments) include a differential pressure transducer that transforms the differential pressure (effective pressure) into an electric signal, a controller, and an actuator; the control functions can be achieved with an Easy controller, with a Compact controller, or with individual components.

For most applications, the setpoint value comes from a room temperature controller. The controller compares the actual value with the setpoint value and alters the control signal of the actuator if there is a difference between the two values. An integral attenuator reduces the noise that is created by the restriction of the airflow. The airflow velocity at the room end is, due to the larger rectangular cross section, about half the velocity in the circular duct

Quick selection

TVB

Volume flow rate ranges

Quick selection tables provide a good overview of the room sound pressure levels that can be expected. Approximate intermediate values can be interpolated. For precise intermediate values please contact TROX Malaysia.

The first selection criteria for the nominal size are the actual volume flow rates \dot{V}_{\min} and \dot{V}_{\max} in ft^3/min (CFM) and in l/s (LPS). The quick sizing tables are based on normally accepted attenuation levels. If the sound pressure level exceeds the required level, a larger VAV terminal unit and/or a silencer is required.

Note

■ Dash (-) indicates values lower than 20.

■ All values calculated based upon attenuation according to AHRI standard 885:2008 Appendix E1. See appendix for detail.

VAV terminal units

Aerodynamic data

TVB

The minimum differential pressure of VAV terminal units is an important factor in designing the ductwork and in rating the fan including speed control.

Sufficient duct pressure must be ensured for all operating conditions and for all control units.

The measurement points for fan speed control must be selected accordingly.

Volume flow rate ranges and minimum differential pressure values

Note

- The volume flow rates given for VAV terminal units depend on the nominal size and on the control component (attachment) that is installed. The table gives the minimum and maximum values for a VAV terminal unit.
- Some control components may only have a limited volume flow rate range. For volume flow rate ranges for all control components refer to TROX Malaysia

All performance data based on test conducted in accordance with AHRI 880-2017.
Sound levels are in decibels, dB ref: 1×10^{-12} watts.

Dash (-) indicates values lower than 15.

Duct End Correction as per AHRI 880-2017 is added in sound power level based on the below:

$$E_1 = 10 \log \left[1 + \left(\frac{0.7C_o}{\pi f D_e} \right)^2 \right]$$

$$D_e = \sqrt{4 \cdot \frac{A}{\pi}}$$

Where A = Internal cross section of duct, ft²
 C_o = Speed of sound in air, ft/s
 D_e = Equivalent diameter , ft
 E_1 = Duct end correction, dB
 f = One- third octave band centre frequency, Hz

All performance data based on test conducted in accordance with AHRI 880-2017.
Sound levels are in decibels, dB ref: 1×10^{-12} watts.

Dash (-) indicates values lower than 15.

Duct End Correction as per AHRI 880-2017 is added in sound power level based on the below:

$$E_1 = 10 \log \left[1 + \left(\frac{0.7C_o}{\pi f D_e} \right)^2 \right]$$

$$D_e = \sqrt{4 \cdot \frac{A}{\pi}}$$

Where A = Internal cross section of duct, ft²
 C_o = Speed of sound in air, ft/s
 D_e = Equivalent diameter , ft
 E_1 = Duct end correction, dB
 f = One- third octave band centre frequency, Hz

All performance data based on test conducted in accordance with AHRI 880-2017.
Sound levels are in decibels, dB ref: 1×10^{-12} watts.

Dash (-) indicates values lower than 15.

Duct End Correction as per AHRI 880-2017 is added in sound power level based on the below:

$$E_1 = 10 \log \left[1 + \left(\frac{0.7C_o}{\pi f D_e} \right)^2 \right]$$

$$D_e = \sqrt{4 \cdot \frac{A}{\pi}}$$

Where
 A = Internal cross section of duct, ft²
 C_o = Speed of sound in air, ft/s
 D_e = Equivalent diameter , ft
 E_1 = Duct end correction, dB
 f = One- third octave band centre frequency, Hz

All performance data based on test conducted in accordance with AHRI 880-2017.
Sound levels are in decibels, dB ref: 1×10^{-12} watts.

Dash (-) indicates values lower than 15.

TVB

Description

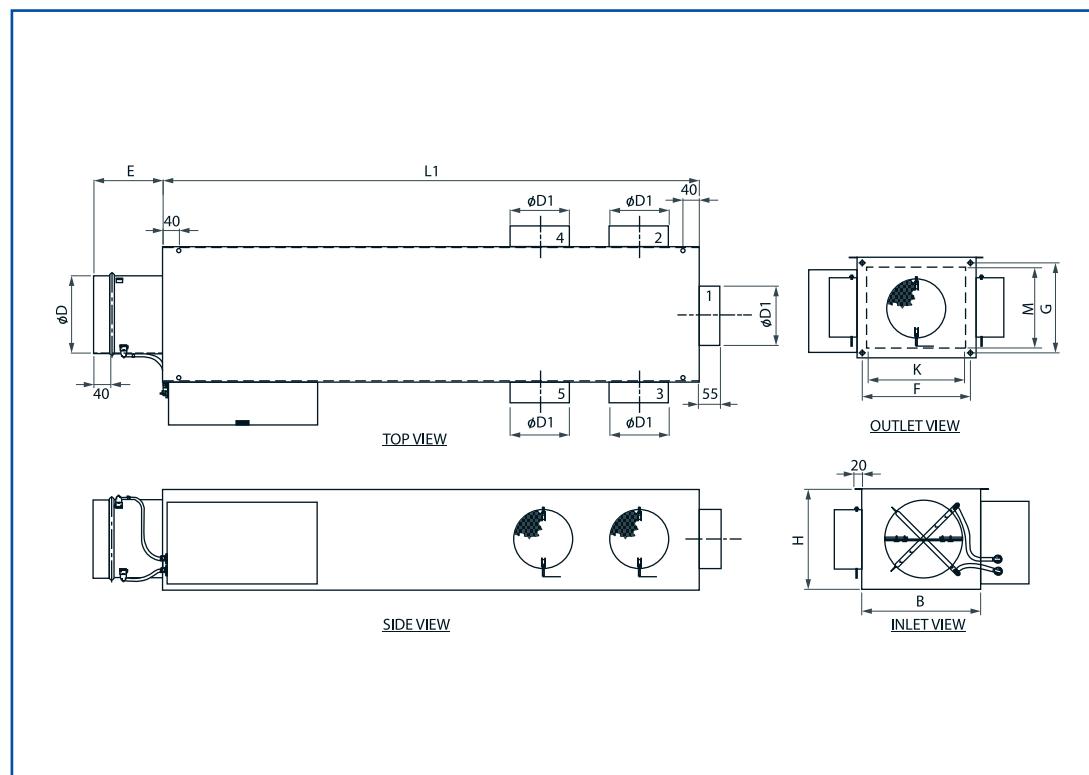

VAV terminal unit,
variant TVB-C

- VAV terminal unit with acoustic cladding for the control of variable supply air volume flows
- For rooms where the case-radiated noise of the unit is not sufficiently reduced by a false ceiling
- The circular ducts for the room under consideration must have adequate acoustic insulation (provided by others) on the fan end.
- Acoustic cladding cannot be retrofitted
- Outlet spigot with adjustable perforated damper

APPENDIX E. TYPICAL SOUND ATTENUATION VALUES – NORMATIVE

E1 The following Table E1 values are required for use by manufacturers to calculate NC values for use in catalogs.

In product catalogs the end use environments are not known and the following factors are provided as uniform attenuation values. Use of these values will allow better comparison between manufacturers.

Table E1. Typical Sound Attenuation Values, dB

Diffusers:

Deduct 10 dB in all Octave Bands to compute diffuser NC

VAV Terminals: Radiated Sound Ceiling Plenum Noise Sources: Total deduct from Sound Power to Predict Room Sound Pressure (Includes Environmental Effect), dB

Assumes, 3 ft [0.9 m] deep plenums with non-bounded sides

	125	250	500	1000	2000	4000	
Type - Mineral Fiber	18	19	20	26	31	36	

From Table D15

VAV Terminals: Discharge Sound, Noise Source in Occupied Space:

	Octave Band Mid Frequency, Hz						
	125	250	500	1000	2000	4000	8000
Small Box (8 x 8 in) [(0.2 x 0.2 m)] < 300 cfm [$\leq 0.1 \text{ m}^3/\text{s}$]	24	28	39	53	59	40	28
Medium Box (12 x 12 in) [(0.30 x 0.30 m)] 300 - 700 cfm [0.1 - 0.3 m^3/s]	27	29	40	51	53	39	30
Large Box (15 x 15 in) [(0.40 x 0.40 m)] > 700 cfm [0.3 m^3/s]	29	30	41	51	52	39	32

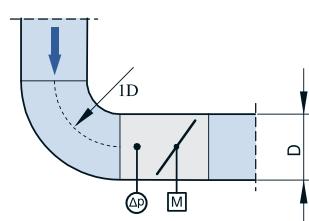

From Table D18

Upstream conditions

The volume flow rate accuracy Δp applies to a straight upstream section of the duct. Bends, junctions or a narrowing or widening of the duct cause turbulence that may affect measurement. Duct connections, e.g. branches off the main duct, must comply with EN1505.

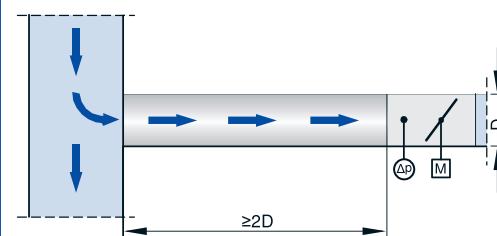

Some installation situations require straight duct sections upstream.

Bend

A radius bend with at least 1D radius at a centre line curvature-without an additional straight duct section upstream of the VAV terminal unit - has only a negligible effect on the volume flow rate accuracy

Junction

A junction causes strong turbulence. The started volume flow rate accuracy ΔV can only be achieved with a straight duct section of at least 2D length upstream. Shorter upstream sections require a perforated plate in the branch and before the VAV terminal unit. If there is no straight upstream section at all, the control will not be stable, even with a perforated plate

Standard text

This specification describes the general properties of the product

VAV terminal units for variable and constant air volume systems, suitable for supply or extract air, available in 9 nominal sizes. Ready-to-commission unit which consists of the mechanical parts and the electronic control components. Each unit contains an averaging differential pressure sensor for volume flow rate measurement and a damper blade.

Factory assembled control components complete with wiring and tubing. Spigot suitable for circular ducts to DW 144, 1998 Position of the damper blade indicated externally at shaft extension. Closed blade air leakage to EN 1751, Class 2 (4 - 10), Class 3 (12, 14, 16)

Special characteristics

- Factory set-up or programming and function testing
- Volume flow rate can later be measured and adjusted on site; additional adjustment device may be necessary

Materials and surfaces

- Casing and damper blade made of galvanized sheet steel
- Damper blade seal made of Chloroprene rubber
- Lining is mineral wool
- Differential pressure sensor made of aluminum
- ABS bearings

Mineral wool

- Internal fiber glass insulation lining.
- Faced with woven glass fabric as protection against erosion through airflow velocities of up to 20 m/s
- Resistant to fungal and bacterial growth

Technical data

- Nominal sizes: 4 to 16 inches
- Volume flow rate range:
10 to 1775 l/s or 21 to 3761 CFM
- Volume flow rate range with electric heater:
56 to 1775 l/s or 119 to 3761 CFM
- Volume flow rate control range (unit with dynamic differential pressure measurement): approx. 10 to 100 % of the nominal volume flow rate
- Minimum differential pressure: 20 Pa
- Maximum differential pressure: 1000 Pa

Attachments

Variable volume flow control with electronic Easy controller to connect an external control signal; actual value signal can be integrated into the central BMS.

- Supply voltage to controller 24 V AC
- Transformer step down from 230 V AC to 24 V AC
- Signal voltages 0(2) – 10 V DC
- Possible override controls with external switches using volt-free contacts:
CLOSED, OPEN, V_{min} and V_{max}
- Potentiometers with percentage scales to set the volume flow rates V_{min} and V_{max}
- The actual value signal relates to the nominal volume flow rate such that commissioning and subsequent adjustment are simplified
- Volume flow rate control range:
approx. 10 – 100 % of the nominal volume flow rate
- Clearly visible external indicator light for signaling the functions:
Set, not set, and power failure

Electrical connections with screw terminal
